

Managing data centre operations

TNT, a global provider of mail and express delivery services, has selected the enterprise software solution Aperture VISTA 400 to enable better equipment planning and environmental control of its data centre operations.

"We wanted a view into our data centre that will enable us to manage it more effectively but also aid us in the future planning of resources," said Dave Carey at TNT NV. "Aperture VISTA 400 will arm us with the information we need for a balanced, controlled data centre and more efficient use of available resources."

TNT's company mission is to provide the best in customer service and exceed expectations in transferring goods and documents around the world. In order to provide the most

reliable and efficient solutions in the distribution and logistics industry, TNT needed an application that could give them the management capabilities and uptime demanded in its data centre.

TNT selected Aperture VISTA 400 based on its critical functionality in infrastructure planning and design. Additionally, TNT plans to use VISTA for provisioning, troubleshooting and analysis.

"The onset of new complex, distributed technologies has intensified IT organisational challenges," said William T. Clifford, Chairman and CEO of Aperture Technologies, Inc. "With Aperture VISTA 400, companies like TNT can keep these systems in check and enable proactive infrastructure planning."
