

NEW VISTA OPEN FOR JS

SAINSBURY'S HAS chosen Aperture Technologies to help its data centre management solution to achieve a better overall view of its data centre technology.

The supermarket will use Vista 500 software to visualise its resources for everyday management, in order to consolidate space and maximise energy efficiency.

All the data centres will eventually be consolidated, and Aperture Vista will be deployed in the move.

Malcolm Ireland, IT production operations manager at Sainsbury's, said: "We expect Vista 500 to help us by providing better access to

configuration records when we are planning changes in our data centres. We want to maintain a pictorial plan for new installs, changes and removals, with easy access to this information for all who need it.

"It will also help us to identify the best place to position equipment to make the best use of our space, cabling infrastructure and cooling."

The Aperture Vista software is designed to help organisations visually manage the physical environment of the data centre, and help organisations with use and capacity planning. ○
